

Saguaro National Park

Centennial Saguaro Survey – Plot 34

December 5, 2015

American Conservation Experience

A crew from American Conservation Experience collected data from plot 34, which was established in 1990. Each column in the graph below indicates how many saguaros were counted. The columns show a size range, from smallest to largest. The light blue columns represent the saguaros ACE monitored. Comparing the data from past surveys, there was a decrease of saguaros as a whole on plot 34. There can be many causes to this decreases such as, a sudden freeze, decrease in rainfall, an increase in temperature, and many other factors. ACE was a pleasure to work with. Most crew members are from other states around the United States and have never seen a saguaro before. By the end of the day, they grew fond of the saguaro and the many fascinating charaterstic the saguaro has. Thanks ACE!

Saguaro Plot #34
